## AP worksheet

### 1. Longest Nice Substring:

**1763. Longest Nice Substring** Solved

1522 Easy Topics Companies Hint

Microsoft

A string *s* is **nice** if, for every letter of the alphabet that *s* contains, it appears **both** in uppercase and lowercase. For example, "aBbB" is nice because 'A' and 'a' appear, and 'B' and 'b' appear. However, "aBb" is not because 'b' appears, but 'B' does not.

Given a string *s*, return the longest **substring** of *s* that is **nice**. If there are multiple, return the substring of the **earliest** occurrence. If there are none, return an empty string.

**Example 1:**  
Input: *s* = "YazaAay"  
Output: "aAa"  
Explanation: "aAa" is a nice string because 'A/a' is the only letter of the alphabet in *s*, and both 'A' and 'a' appear. "aAa" is the longest nice substring.

**Example 2:**  
Input: *s* = "Bb"  
Output: "Bb"  
Explanation: "Bb" is a nice string because both 'B' and 'b' appear. The whole string is a substring.

```
1 class Solution {
2 private:
3     bool isNice(string& str){
4         for(char c:str){
5             if(islower(c)&&str.find(toupper(c))==string::npos){
6                 return false;
7             }
8             if(isupper(c)&&str.find(tolower(c))==string::npos){
9                 return false;
10            }
11        }
12        return true;
13    }
14 public:
15    string longestNiceSubstring(string s) {
16        string ans="";
17        int n=s.length();
18        for(int i=0;i<n;i++){
19            for(int j=i+1;j<n;j++){
20                string sub=s.substr(i,j-i+1);
21                if(isNice(sub)){
22                    if(sub.length()>ans.length()){
23                        ans=sub;
24                    }
25                }
26            }
27        }
28        return ans;
29    }
30 }
```

### 2. Reverse Bits

**190. Reverse Bits** Solved

Easy Topics Companies

Apple Facebook Qualcomm Microsoft Google

Reverse bits of a given 32 bits unsigned integer.

**Note:**

- Note that in some languages, such as Java, there is no unsigned integer type. In this case, both input and output will be given as a signed integer type. They should not affect your implementation, as the integer's internal binary representation is the same, whether it is signed or unsigned.
- In Java, the compiler represents the signed integers using **2's complement notation**. Therefore, in **Example 2** above, the input represents the signed integer -3 and the output represents the signed integer -187471325.

**Example 1:**  
Input: *n* = 00000001000000000000000011011001100  
Output: 964176192 (0011100101110000010100101000000)  
Explanation: The input binary string 00000001000000000000000011011001100 represents the unsigned integer 43261596, so return 964176192 which its binary representation is 0011100101110000010100101000000.

```
1 class Solution {
2 public:
3     uint32_t reverseBits(uint32_t n) {
4         uint32_t ans = 0;
5
6         for (int i = 0; i < 32; ++i) {
7             if (n >> i & 1) {
8                 ans |= 1 << 31 - i;
9             }
10        }
11        return ans;
12    }
13 }
```

Accepted Runtime: 2 ms

Case 1 Case 2

Input

*n* = 00000001000000000000000011011001100

Output

964176192 (0011100101110000010100101000000)

### 3. Number of 1 Bits:

**191. Number of 1 Bits** Solved

Easy Topics Companies

Box Facebook Cisco Amazon Google

Given a positive integer  $n$ , write a function that returns the number of **set bits** in its binary representation (also known as the **Hamming weight**).

**Example 1:**  
Input:  $n = 11$   
Output: 3  
Explanation:  
The input binary string **1011** has a total of three set bits.

**Example 2:**  
Input:  $n = 128$   
Output: 1  
Explanation:  
The input binary string **10000000** has a total of one set bit.

### 4. Maximum Subarray:

**53. Maximum Subarray** Solved

Medium Topics Companies

LinkedIn Amazon Apple Microsoft Adobe

Given an integer array **nums**, find the **subarray** with the largest sum, and return its sum.

**Example 1:**  
Input:  $nums = [-2, 1, -3, 4, -1, 2, 1, -5, 4]$   
Output: 6  
Explanation: The subarray **[4, -1, 2, 1]** has the largest sum 6.

**Example 2:**  
Input:  $nums = [1]$   
Output: 1  
Explanation: The subarray **[1]** has the largest sum 1.

**Example 3:**  
Input:  $nums = [5, 4, -1, 7, 8]$   
Output: 23  
Explanation: The subarray **[5, 4, -1, 7, 8]** has the largest sum 23.

## 5. Search a 2D Matrix II:

**240. Search a 2D Matrix II** Solved

Medium Topics Companies

Amazon Microsoft Bloomberg Apple Facebook

Write an efficient algorithm that searches for a value `target` in an `m x n` integer matrix `matrix`. This matrix has the following properties:

- Integers in each row are sorted in ascending from left to right.
- Integers in each column are sorted in ascending from top to bottom.

**Example 1:**

1	4	7	11	15
2	5	8	12	19
3	6	9	16	22
10	13	14	17	24

```
1 class Solution {
2 public:
3     bool searchMatrix(vector<vector<int>>& matrix, int target) {
4         int row = matrix.size();
5         int col = matrix[0].size();
6
7         int rowIndex = 0;
8         int colIndex = col-1;
9
10        while(rowIndex < row && colIndex >= 0){
11            int element = matrix[rowIndex][colIndex];
12
13            if(element == target){
14                return true;
15            }
16        }
17        return false;
18    }
19 }
```

Input

matrix =

[ [1,4,7,11,15], [2,5,8,12,19], [3,6,9,16,22], [10,13,14,17,24], [18,21,23,26,30] ]

target =

5

## 6. Super Pow:

**372. Super Pow**

Medium Topics Companies

Adobe

Your task is to calculate  $a^b \bmod 1337$  where  $a$  is a positive integer and  $b$  is an extremely large positive integer given in the form of an array.

**Example 1:**

Input:  $a = 2, b = [3]$

Output: 8

**Example 2:**

Input:  $a = 2, b = [1,0]$

Output: 1024

**Example 3:**

Input:  $a = 1, b = [4,3,3,8,5,2]$

Output: 1

**Constraints:**

- $1 \leq a < 2^{31}$
- $1 \leq b.length \leq 2000$
- $0 \leq b[i] < 10$

```
12 private:
13     static constexpr int kMod = 1337;
14
15     long modPow(long x, long n) {
16         if (n == 0)
17             return 1;
18         if (n % 2 == 1)
19             return x * modPow(x % kMod, (n - 1) / 2) % kMod;
20         return modPow(x * x % kMod, n / 2) % kMod;
21     }
22
23     int superPow(int a, vector<int>& b) {
24         return modPow(a, b[0]) % kMod;

## 7. Beautiful Array:

**932. Beautiful Array**

2294 Medium Topics Companies

An array `nums` of length `n` is **beautiful** if:

- `nums` is a permutation of the integers in the range `[1, n]`.
- For every  $0 \leq i < j < n$ , there is no index `k` with  $i < k < j$  where  $2 * \text{nums}[k] == \text{nums}[i] + \text{nums}[j]$ .

Given the integer `n`, return *any* beautiful array `nums` of length `n`. There will be at least one valid answer for the given `n`.

**Example 1:**

Input:  $n = 4$

Output: [2,1,4,3]

**Example 2:**

Input:  $n = 5$

Output: [3,1,2,5,4]

**Constraints:**

- $1 \leq n \leq 1000$

```
15 divide(arr, l, r, mask << 1);
16 divide(arr, r + 1, r, mask << 1);
17 }
18
19 int partition(vector<int>& arr, int l, int r, int mask) {
20     int nextSwapped = l;
21     for (int i = l; i <= r; ++i)
22         if ((arr[i] & mask) & (arr[nextSwapped] & mask))
23             swap(arr[i], arr[nextSwapped++]);
24     return nextSwapped - 1;
25 }
26 }
```

## 8. The Skyline Problem:

**218. The Skyline Problem**

Hard Topics Companies

Microsoft Cruise Automation Google Uber

A city's **skyline** is the outer contour of the silhouette formed by all the buildings in that city when viewed from a distance. Given the locations and heights of all the buildings, return the **skyline** formed by these buildings collectively.

The geometric information of each building is given in the array `buildings` where `buildings[i] = [lefti, righti, heighti]`:

- `lefti` is the x coordinate of the left edge of the *i*<sup>th</sup> building.
- `righti` is the x coordinate of the right edge of the *i*<sup>th</sup> building.
- `heighti` is the height of the *i*<sup>th</sup> building.

You may assume all buildings are perfect rectangles grounded on an absolutely flat surface at height 0.

The **skyline** should be represented as a list of "key points" sorted by their x-coordinate in the form `[[x1,y1],[x2,y2],...]`. Each key point is the left endpoint of some horizontal segment in the skyline except the last point in the list, which always has a y-coordinate 0 and is used to mark the skyline's termination where the rightmost building ends. Any ground between the leftmost and rightmost buildings should be part of the skyline's contour.

**Note:** There must be no consecutive horizontal lines of equal height in the output.

Accepted Runtime: 0 ms

Case 1 Case 2

Input

buildings =  
[[2,9,10],[3,7,15],[5,12,12],[15,20,10],[19,24,8]]

Output

[[2,10],[3,15],[7,12],[12,0],[15,10],[20,8],[24,0]]

## 9. Reverse Pairs:

**493. Reverse Pairs**

Hard Topics Companies Hint

Amazon

Given an integer array `nums`, return the number of **reverse pairs** in the array.

A **reverse pair** is a pair  $(i, j)$  where:

- $0 \leq i < j < \text{nums.length}$  and
- $\text{nums[i]} > 2 * \text{nums[j]}$ .

**Example 1:**

Input: `nums = [1,3,2,3,1]`  
Output: 2  
Explanation: The reverse pairs are:  
(1, 4)  $\rightarrow \text{nums}[1] = 3, \text{nums}[4] = 1, 3 > 2 * 1$   
(3, 4)  $\rightarrow \text{nums}[3] = 3, \text{nums}[4] = 1, 3 > 2 * 1$

**Example 2:**

Input: `nums = [2,4,3,5,1]`  
Output: 3  
Explanation: The reverse pairs are:  
(1, 4)  $\rightarrow \text{nums}[1] = 4, \text{nums}[4] = 1, 4 > 2 * 1$

nums =  
[1,3,2,3,1]

Output

2

## 10. Longest Increasing Subsequence II:

**2407. Longest Increasing Subsequence II**

2280 Hard Topics Companies Hint

You are given an integer array `nums` and an integer `k`.

Find the longest subsequence of `nums` that meets the following requirements:

- The subsequence is **strictly increasing** and
- The difference between adjacent elements in the subsequence is **at most** `k`.

Return the length of the **longest subsequence** that meets the requirements.

A **subsequence** is an array that can be derived from another array by deleting some or no elements without changing the order of the remaining elements.

**Example 1:**

Input: `nums = [4,2,1,4,3,4,5,8,15]`, `k = 3`  
Output: 5  
Explanation: The longest subsequence that meets the requirements is `[1,3,4,5,8]`. The subsequence has a length of 5, so we return 5. Note that the subsequence `[1,3,4,5,8,15]` does not meet the requirements because `15 - 8 = 7` is larger than 3.
